

USING EDUCATIONAL PLATFORMS IN THE PRIMARY EDUCATION PROCESS.

Ko'kenova Madina Zamonbek kizi

primary school teacher of general secondary school №7,
Zangiota district, Tashkent region.

Abstract: This article examines the pedagogical significance of using educational platforms in the process of primary education and their role in developing students' knowledge, skills, and competencies. In addition, the advantages of digital platforms, the challenges encountered in their implementation, and recommendations for effective use are discussed.

Keywords: primary education, educational platforms, digital technologies, interactive learning, competency.

Аннотация: Аннотация: В данной статье рассматривается педагогическая значимость использования образовательных платформ в процессе начального образования, а также их роль в развитии знаний, умений и компетенций учащихся. Кроме того, анализируются преимущества цифровых платформ, проблемы, возникающие при их применении, и даются рекомендации по их эффективному использованию.

Ключевые слова: начальное образование, образовательные платформы, цифровые технологии, интерактивное обучение, компетенция.

Introduction.

Today, the rapid development of digital technologies in the education system requires new approaches to organizing the learning process. Especially at the primary education stage, the use of educational platforms is of great importance in increasing students' interest, as well as in developing their independent thinking and creative activity. Educational platforms make it possible to present learning materials in an interactive, visual, and easily understandable form.

Teachers working in educational institutions must have a thorough understanding of how to organize teaching methods at an optimal level and how to enrich the theory of forming a well-rounded individual with new ideas. Indeed, the successful implementation of the ideas of the National Program for Personnel Training and the achievement of educational reforms being carried out in our country largely depend on the moral character and professional competence of teachers and educators working in educational institutions.¹

Educational platforms are digital environments designed to organize, manage, and monitor the learning process. In primary education, widely used platforms include electronic textbooks, online exercises, testing systems, video lessons, and game-based educational applications. These platforms are developed by taking into account the age and psychological characteristics of learners.

Education forms the foundation of human development. In the new era, the comprehensive progress and advancement of society directly depend on the development of education and the continuous improvement of its content. At the same time, the globalization of education, the introduction of innovative technologies, and the large-scale flow of information require the constant renewal and enhancement of educational content.²

Primary education's use of educational platforms is considered an important component of modern pedagogical approaches. These platforms serve to organize the learning process in an effective, engaging, and learner-centered manner.

First of all, the use of educational platforms increases students' interest in lessons, as they incorporate colorful visual materials, interactive tasks, and game elements. This corresponds well to the age and psychological characteristics of primary school students. In addition, such platforms help develop independent learning skills; that is, students gain the opportunity to complete tasks on their own, analyze their mistakes, and reinforce their knowledge.

Educational platforms have another important advantage—the ability to personalize learning materials. Tasks can be adapted by taking into account each learner's level of knowledge, abilities, and pace of learning. In addition, these platforms strengthen interaction between teachers and students, as they make it easier to exchange feedback quickly, check assignments, and provide guidance. Educational platforms also simplify the processes of assessment and analysis, giving teachers the opportunity to closely monitor students' progress. Overall, a learning process organized on the basis of interactive tasks and game-based technologies ensures that students acquire knowledge in an easy, effective, and engaging way.

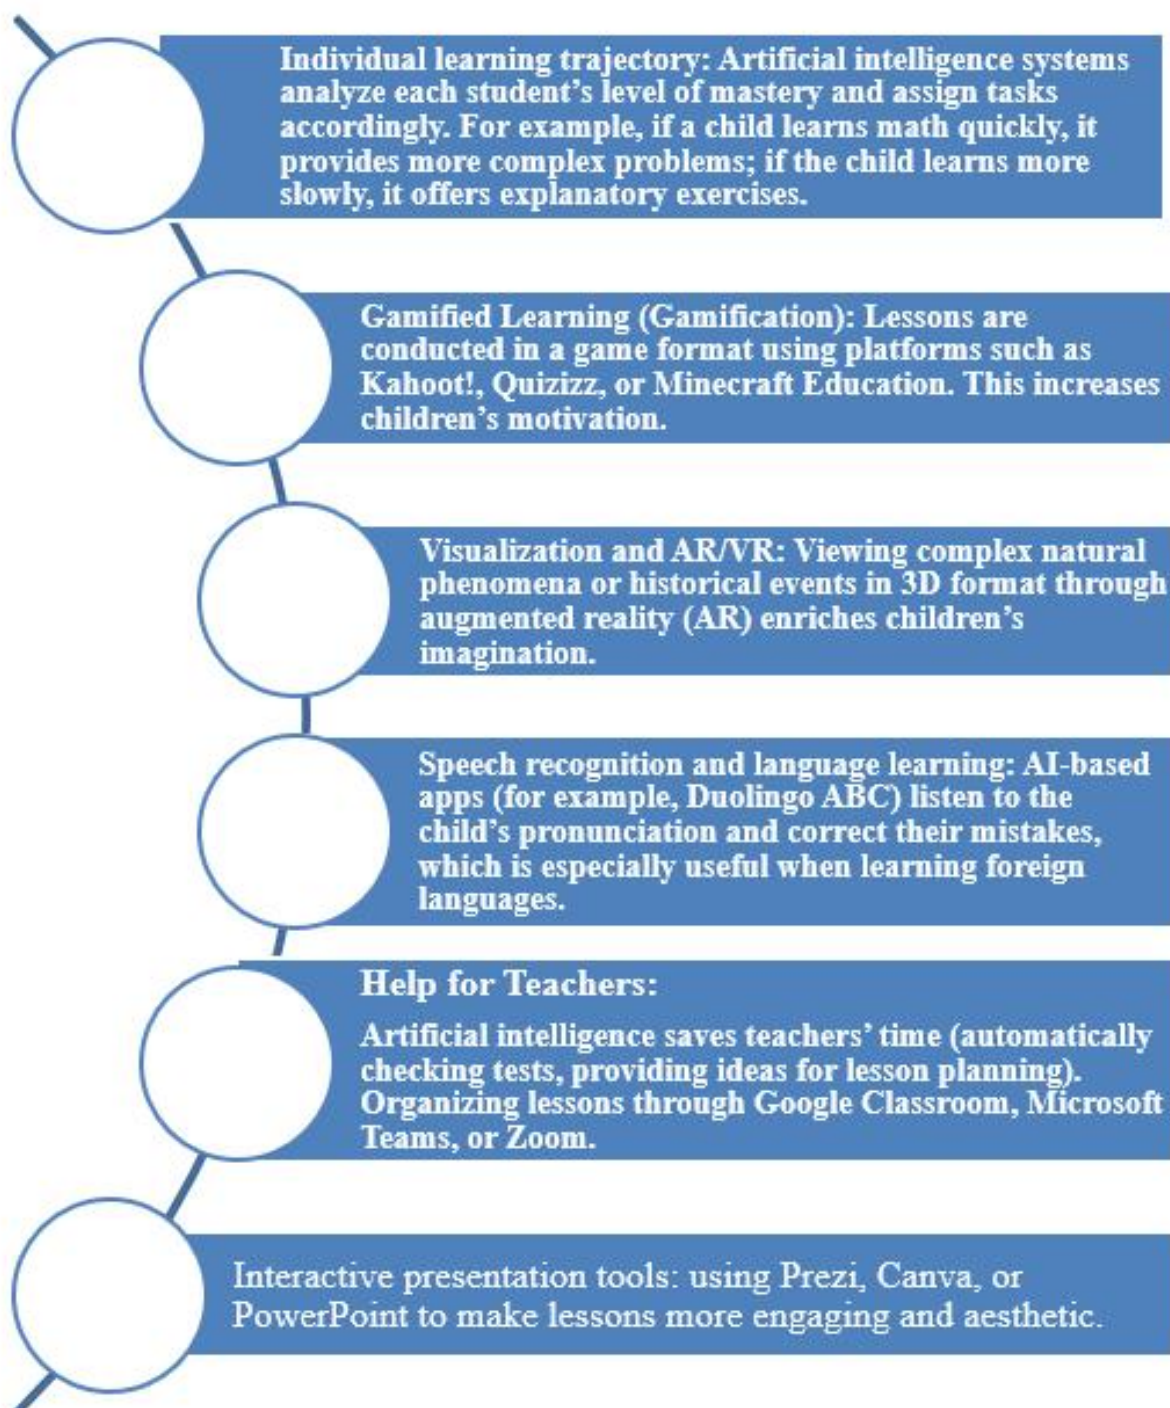

At the same time, there are also certain challenges in implementing educational platforms. In particular, issues such as a lack of technical equipment, low internet speed, and insufficient digital competence of teachers are commonly encountered. In addition, long periods of time spent in front of screens by primary school students may have a negative impact.

Effective use of educational platforms is an important component of the modern education system. Their proper and purposeful integration into the educational process depends on a number of factors. First of all, it is necessary to improve teachers' digital literacy, as full utilization of the platforms' capabilities directly depends on the educator's technological knowledge and skills.

Additionally, using educational platforms in moderation during the lesson process is of great importance. Excessive reliance on digital tools may reduce students' attention; therefore, they should be used in accordance with the lesson content.

METHODS OF APPLICATION IN PRIMARY EDUCATION:

In the educational process, taking into account students' age and psychological characteristics is one of the important aspects. Using digital resources that are appropriate for each age group increases the effectiveness of education. In addition, establishing cooperation with parents ensures that students use educational platforms correctly and safely. Another important aspect is integrating traditional and digital teaching methods. This approach preserves

the continuity of the educational process while making learning more effective and engaging for students.

Summary:

In summary, using educational platforms in the primary education process helps to improve the quality and effectiveness of education. When digital platforms are used correctly and purposefully, they make the learning process more interesting and efficient for students. Therefore, introducing and developing educational platforms in the education system is considered one of the important tasks.
